

ZODIACCHAIN

Chainlink-Facing Grant Memo
Testnet-First Verifiable Betting Infrastructure Powered by Chainlink VRF

Public Testnet MVP · Verifiable Draw Flow · Fairness Dashboard
Version 1.0 · April 2026

1. Project Summary

ZodiacChain is a decentralized, verifiable betting infrastructure being built on Polygon with Chainlink VRF as its core randomness primitive.

The protocol combines two independently auditable dimensions:

- a **Terrestrial Dimension**, based on a deterministic 00–99 mapping across 25 animals
- a **Celestial Dimension**, based on an **Exact Celestial Number (01–60)** from which Celestial Animal and Element are deterministically derived

At this stage, ZodiacChain is seeking support only for public testnet validation, verifiable draw infrastructure, and reviewer-facing transparency tooling. The current objective is to build a **public testnet MVP**, a **verifiable draw flow**, and a **fairness dashboard** that demonstrate how Chainlink VRF can power a transparent consumer-facing application with clear rules, deterministic mappings, and visible protection logic.

ZodiacChain is designed as verifiable draw infrastructure, not as a live regulated wagering service.

2. Why Chainlink

ZodiacChain is directly aligned with Chainlink because the protocol's core trust layer depends on **provably fair, publicly verifiable randomness**.

The project is a strong fit for Chainlink-facing support for three reasons:

1. **VRF is mission-critical**, not optional
The legitimacy of the draw system depends on unpredictable randomness that can still be verified publicly.
2. **The protocol makes verifiability visible to end users**
ZodiacChain is not only integrating VRF at the contract level; it is also exposing the result flow, derived outputs, and protection logic through a public-facing fairness interface.
3. **The use case is consumer-facing and understandable**
ZodiacChain can serve as a live demonstration of how Chainlink VRF enables transparent, user-comprehensible outcomes in applications where fairness is essential.
4. **Decentralized Execution via Chainlink Automation** Beyond randomness, the protocol requires punctuality and autonomy. We will utilize Chainlink Automation to trigger the draw functions within `ZodiacDraw.sol` in a fully

decentralized manner. This eliminates the need for centralized scripts or human intervention to initiate the Terrestrial (4h) and Celestial (daily) cycles, ensuring the protocol operates as an autonomous and impartial infrastructure.

5. Reference Implementation & Educational Value

ZodiacChain is intended to serve as a public reference implementation for consumer-facing verifiable randomness on EVM networks. The protocol is designed not only to use Chainlink VRF internally, but also to make the full draw logic publicly visible through documentation, deterministic mappings, and a fairness dashboard.

This gives the project educational value beyond its own application layer. Developers, reviewers, and ecosystem participants can observe how verifiable randomness is requested, fulfilled, interpreted, and presented to users in a transparent and reproducible manner.

3. What This Funding Round Is For

This round is strictly focused on **documentation, testnet infrastructure, and public technical demonstration**.

It is intended to fund:

- a **public testnet MVP**
- a **VRF-backed draw implementation**
- deterministic Terrestrial and Celestial outcome logic
- a **public fairness dashboard**
- open technical documentation and repository refinement
- basic beta validation of the user-facing testnet flow

This round is limited to:

- public real-money launch
- token presale
- token issuance
- full mainnet commercialization
- licensing execution
- public testnet MVP execution
- verifiable draw infrastructure
- public fairness dashboard
- documentation and repository refinement
- technical validation planning

4. Core Product Mechanics to Be Demonstrated

The grant-funded MVP will demonstrate the following mechanics:

4.1 Terrestrial Dimension

A 00–99 numerical system where each group of four consecutive numbers maps to one of the 25 animals.

Core demonstrable outputs:

- animal outcome mapping
- exact tens
- hundreds
- thousands
- public rules visibility

4.2 Celestial Dimension

A single official result represented by the **Exact Celestial Number (01–60)**.

From this result, the protocol deterministically derives:

- Celestial Animal
- Celestial Element

Core demonstrable outputs:

- official 01–60 result
- public derivation logic
- animal mapping
- element mapping
- example-based transparency

4.3 Combined Outcome Layer

The MVP will also demonstrate cross-dimensional bet logic and payout calculation transparency, including:

- Terrestrial + Celestial combination logic
- public multiplier logic
- visible rules and restrictions
- deterministic payout explanation

5. Why This Matters for the Chainlink Ecosystem

ZodiacChain is not only a VRF integration; it is a **consumer-facing demonstration of verifiability**.

ZodiacChain adds value to the Chainlink ecosystem as a consumer-facing showcase of verifiable randomness in practice. The project is structured not only as a product MVP, but also as a public demonstration of deterministic result derivation and visible fairness protections.

This makes the protocol useful as both a reference implementation for builders and an educational example for the broader ecosystem.

The project adds ecosystem value by showing how Chainlink VRF can support:

- understandable randomness-backed user experiences
- transparent rule systems
- deterministic post-draw derivation
- public fairness dashboards
- trust-minimized onboarding for non-technical users

Instead of using VRF as a hidden backend primitive, ZodiacChain turns it into part of the product's visible trust layer.

6. Requested Support

Primary ask: consideration for Chainlink Build participation and ecosystem support.

Secondary funding ask (if evaluated through a grant pathway):

USD 35,000 equivalent in milestone-based support for the first public technical phase.

This amount is sized for:

- MVP testnet implementation
- VRF-backed draw flow
- fairness dashboard
- public documentation refinement
- specialist support for smart contract and frontend execution

This request is intentionally narrower than a full commercial launch budget.

7. Milestones & Deliverables

Milestone 1 — Public Documentation & Technical Pack

Timeline: Month 1

Deliverables:

- finalized public whitepaper
- refined public repository

- public rules specification
- technical architecture notes
- Chainlink-facing technical narrative
- demo scope definition

Milestone 2 — VRF-Backed Testnet Draw Flow

Timeline: Month 2–3

Deliverables:

- `ZodiacDraw.sol` implemented on testnet
- Chainlink VRF-backed draw request and fulfillment flow
- **Chainlink Automation** setup for decentralized, autonomous execution of draw cycles (4h Terrestrial / 24h Celestial).
- Deterministic 01–60 derivation logic and Terrestrial 00–99 mapping.
- public result emission and verifiable draw output view.

Milestone 3 — Core Betting Logic on Testnet

Timeline: Month 2–4

Deliverables:

- `ZodiacBetting.sol` testnet deployment
- rule validation for supported MVP bet types
- protection logic implementation
- concentration cap enforcement
- solvency checks
- event logging for public transparency

Milestone 4 — Fairness Dashboard & Public Demo

Timeline: Month 3–5

Deliverables:

- public dashboard for draw history
- display of Exact Celestial Number
- derived Celestial Animal and Element view
- visible pool protection logic
- public demo environment
- end-to-end testnet walkthrough

Milestone 5 — Beta Readiness Memo

Timeline: Month 5

Deliverables:

- technical readiness summary
- public beta access plan
- repository status update

- next-phase roadmap memo
 - Build/grant follow-up report
-

8. Budget Breakdown

Category	Estimated Cost (USD)	Purpose
Smart contract contributor	14,000–18,000	Testnet contract logic, VRF integration, rules implementation
Frontend / Web3 contributor	7,000–10,000	Public MVP interface, wallet connection, dashboard UI
Documentation & product packaging	2,000–3,500	Public repo polish, diagrams, technical copy, support docs
Infrastructure & tooling	2,000–3,500	Hosting, RPC, analytics, demo operations, and testnet LINK/Gas subsidies for VRF & Automation.
QA and validation support	2,000–3,000	Scenario validation, testing discipline, bug checks
Contingency	2,500–4,000	Integration fixes and delivery buffer

Target total: approximately **USD 35,000 equivalent**

9. Current Status

ZodiacChain already has the following foundations in place:

- finalized core product logic
- deterministic Celestial derivation model
- documented Terrestrial mapping structure

- documented protection rules
- public-facing project identity
- core team in place
- public whitepaper and docs repository
- grant-oriented compliance framing

The remaining work is execution of the public technical layer.

10. Token Posture

ZDC is **not** part of the ask in this funding round.

For this phase:

- ZDC-related fundraising or distribution is outside the current scope
- no ZDC launch is assumed
- gameplay is not dependent on ZDC ownership
- any future ZDC layer would require separate legal, technical, and governance review

Any future token layer is treated as a **separate, later-stage ecosystem and governance topic**, to be considered only after:

- MVP validation
 - legal structuring
 - jurisdiction selection
 - further documentation and review
-

11. Compliance Posture

This funding round is framed conservatively.

It is limited to:

- public documentation
- testnet infrastructure
- technical demonstration
- transparency tooling

It excludes Brazilian operating access, commercial rollout, and regulated production deployment.

ZodiacChain's current position is:

- **favorable-jurisdiction-first** for any future regulated commercial phase
- **Brazil excluded from Phase 1 commercial operations**

- legal, regulatory, and operational review required before any regulated commercial stage
-

12. Core Team

The current core team is strong in backend engineering, systems analysis, QA, product structuring, and business coordination. Our background is primarily rooted in software delivery rather than deep commercial blockchain execution, which is why ZodiacChain is intentionally positioned as a testnet-first, milestone-based project at this stage.

We already own the protocol logic, deterministic mappings, protection rules, product architecture, and technical delivery planning required for the MVP phase. Specialized roles in Solidity, Web3 frontend, legal/regulatory structuring, and external security review remain open by design and are part of the next execution layer this grant is intended to accelerate.

Edson Marinho Gomes — Founder, Product & Backend Lead

Recife, Brazil · Full-time

6 years in backend systems, product development, and business-rule design.

Leads product architecture, roadmap alignment, technical framing, and execution planning.

Key strengths:

- product strategy and roadmap alignment
- backend architecture and rules design
- cross-functional execution leadership

Bismark Jamerson — Backend Engineer & Software Analyst

Recife, Brazil · Full-time

6 years in backend systems and software analysis.

Supports implementation planning, requirements translation, integration design, and technical execution.

Key strengths:

- backend systems design
- requirements analysis and technical translation
- integration and problem-solving execution

José Rodrigues Lins Neto — QA Lead

Recife, Brazil · Full-time

13+ years in quality assurance, validation planning, and release control.

Responsible for test discipline, critical-flow validation, acceptance logic, and quality processes.

Key strengths:

- test strategy and validation planning
- defect management and release quality control
- QA process design

Italo Melo — Business Development & Partnerships Lead

Recife, Brazil · Full-time

4+ years in partnership-facing and business communication roles, with fluent English. Leads outreach, stakeholder communication, grant coordination, and international positioning.

Key strengths:

- partnership outreach and relationship management
 - stakeholder communication and grant coordination
 - business negotiation and international positioning
-

13. Critical Roles Still to Be Filled

- Smart Contract / Solidity Lead
 - Frontend Web3 Engineer
 - Legal & Regulatory Counsel
 - External Security Auditor
-

15. Closing Rationale

ZodiacChain is a strong Chainlink-facing candidate because it uses VRF not just as a backend dependency, but as the visible trust foundation of the product.

This is a narrow, credible, milestone-based request focused on:

- public technical execution
- verifiable randomness
- deterministic result interpretation
- transparent protection logic
- testnet demonstration for broader ecosystem value

The goal of this round is simple: to turn a well-documented protocol concept into a public, VRF-backed, demonstrably fair testnet product that shows how Chainlink infrastructure can power transparent consumer-facing experiences.

The broader value of ZodiacChain is not limited to its own application layer. As a public reference implementation and educational demonstration, it can help illustrate how Chainlink VRF supports transparent, understandable, and trust-minimized consumer experiences.
